No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of hits satisfying chosen parameters:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein search, using

The molecules, antibodies, and methods are useful for treating cancer, viral infection and an autoimmune disease. The invention is useful in gene therapy. The present sequence is mouse Gl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated molecule comprising an antibody that binds with a human major histocompatibility complex (MHC) class I being complexed with restricted antigen, useful for treating cancer, viral infection or antigen.
Novel antibody that specifically binds detecting a cell bearing MUC-1 antigen,

The antibody comprises a domain having a sequence of a polypaptide selected from 12E variable light (VL) or variable heavy (VH) domain, 3D VL or VH domain, A5 VL or VH domain and C4 VL or VH domain. Antibodies of the invention are useful for detecting a cell bearing a MUC-1 antigen. The invention is useful for producing a variety of human or humanised antibodies or diabodies. The invention is also
                                                                                                                    Preparation of water-soluble eukaryotic bridges e.g. rPA, comprises cultivation presence of arginine or amide compound.
                                                                                                                                                                                                                  WPI; 2000-674185/66.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cysteine units bound via a disulfide bridge which comprises cultivation of prokaryotic cells in the presence of arginine or an amide compound. The method is useful for the preparation of eukaryotic proteins e.g. proteasses, interferons, protein hormones, antibodies or antibody fragments (e.g. a single chain FV fragment that binds to thyroid stimulating hormone). It is especially useful for preparing proteins with more than five disulfide bridges, e.g. recombinant plasminogen activator (IPA). The technique is simple and does not require in vitro aftertreatment, such as the removal of inclusion bodies, reduction or
The present invention relates to a method for production of a naturally folded eukaryotic protein containing two or more cysteines linked by disulfide bridges. The method comprises co-expression and secretion into
                                                                                                                                                                         Producing naturally folded eukaryotic proteins e.g. interferon, hormones or proteases that contain two clinked by disulfide bridges comprises co-expression

This invention describes a novel method for preparing a naturally folded eukaryotic polypeptide (I) that contains two or more disulfide-bridged Cys residues by culturing prokaryotic cells that contain an expression vector for (I) including a prokaryotic signal sequence at its N-terminus and a nucleic acid (II) that secretes a chaperone protein (III) into the periplasm. (I) is secreted into the periplasm or medium; the signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the periplasm of a molecular chaperone via an expression vector coding for the chaperone. The expression vector also encodes a signal sequence. The method is useful for producing a naturally folded eukaryotic protein such as an antibody, antibody fragment, interferon, protein hormone or a protease containing two or several cysteines linked by disulfide bridges. The present sequence is a fusion protein composed of the PelB signal sequence and ScFvOxazolon. This sequence was used in the method of the
                                                                                                                                                                                              Disclosure;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peptide is then cleaved and (I) isolated from the periplasm or medium. The method is used for production of antibody, interferon, protein hormone or protease. Expression of (III) increases the yield of (I). The method is simple and eliminates time-consuming in vitro processing operations such as dissolution of inclusion bodies, reduction and refolding. (III) protects (I) against agglomeration and promotes their
                                                           Producing water-soluble, naturally folded, and secreted eukaryotic polypeptide, involves culturing prokaryotic cells containing an expression vector encoding the polypeptide in the presence of arginine

CC The method involves culturing the prokaryotic cells, containing an CC expression vector encoding the desired protein and the prokaryotic signal CC sequence, in the presence of an additive, e.g., L-rayinine. The signal CC sequence mediates the secretion of the desired protein into the CC pariplasm, where folding of the protein takes place. The prokaryotic cell CC also contains an expression vector encoding a molecular chaperone, e.g., CC DnaJ and heat shock protein 25 (HSP25). The simultaneous co-CC encombinantly produces a high yield of eukaryotic secreted proteins in the present sequence is an antibody, antibody fragment, interferon, protein hormone or a CC protease. The present sequence is an Erwinia carotovora pectate lyase B (PelB) signal sequence-scFvOx fusion protein encoded by pUBS520-pIN-CC sefvOx. The plasmid, pUBS520-pIN-scFvOx, also comprises the lac promoter. CC exazolon (ScFvOxxazolon), is an antibody fragment against the hapten coxazolon (ScFvOxxazolon), is an antibody fragment against the hapten CC chaperone properties is used as a negative control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The present sequence represents a single chain antibody (scAb) that has 2 CC c-myc epitopes. The scAb is used in claimed methods for localizing a CC probe and for detecting a post-translational activity in a cell, and is CC expressed by a claimed transgenic non-human animal. The invention CC provides methods and reagents for targeting probes to selected cellular CC locations through the expression of specific binding partners (such as CC scAbs) within a cell, and for creating assays for post-translational CC intracellular, specific binding partners over time and in response to Stimuli, such as test chemical spectroscopic probes can be used to CC screen a test chemical for activity. The invention also includes cells and transgenic organisms comprising the intracellular specific binding partner, where the specific binding partner can bind with the Spectroscopic probe/ligand conjugate. scAbs can be expressed within the CC cell and can be designed to bind a wide variety of spectroscopic probes, CC spectroscopic probes that have better (and more diverse) grectroscopic properties than green fluorescent protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

coded biomolecules in an organism and involves changing the distribution
of ATP and/or ADP in cells of the organism. The yield of transgenic
molecules in host cells is often insufficient for industrial production.
The method increases the yield of transgenic molecules in animal and
plant host cells, therefore facilitating their production on an
industrial scale. The proteins produced by the method are useful for
diagnosing, preventing and/or treating viral diseases and cancer. The
present sequence represents a single-chain (scFv) antibodies in transgenic
exemplify the increase in the expression of scFv antibodies in transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing the content of transgene-coded biomolecules in a plant or animal, useful for producing proteins for diagnosing, preventing and/or treating viral diseases and cancer, comprises changing the distribution of ATP and/or ADP.
                                                                                                                                                                                                                             BCFV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the use of a polypeptide that binds a ketone derived from oxazole for generating pathogen resistance in an organism. This can be used to impart resistance to pathogens (bacteria, fungi or viruses) to a wide range of plants (e.g. cereals, sugar beet, tobacco etc.), humans, farm animals and petts. Exemplified are activities against Phytophthora infestans and Erwinia carotovora in potatoes and Staphylococcus aureus in mice. The present sequence is a sc-Fv antibody, which is capable of binding 2-phenyloxazol-5-one
                                                                                                                                                                                                                                   Primer; human; immunoglobulin; Ig; variable region; VH; VL; Ck; JH; lymphocyte; vector; soluble; antibody; phage; linker; back; VH3; nes in-cell PCR; cloning; polymorphic; TCR V; antiphenyloxazolone; hybr: NQ2/12.4; NQ10/12.5.

                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAR32840-43 show the mature heavy chain VH domains and the Vk light chain genes of the antiphenyloxazolone hybridomas NQ2/12.4 and NQ10/12.5 which have been linked via a linker peptide by incell PCR. The cDNA encoding these peptides was synthesised using forward primers annealing to the Ck gene and the JH segment, followed by assembly with linker primers, VH back primers based on the VH3 leader sequence and a forward Ck primer nested in respect to the primer used for cDNA. The assembled product within the cells is then amplified with nested primers annealing to the 5' end of the VH gene and the 3' end of the JK segment. In-cell PCR may be used to determine gene linkage analysis, particularly for the cloning of gene combinations that are polymorphic within a population of cells, such as the rearranged genes for Ig or TCR V regions. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                         The present sequence is that of a single chain Fv (scFv) derivative of antibody 198/A1, comprising the heavy (VH) and 11ght (VL) chain variable regions of 198/A1 joined by an artificial, flexible linker peptide. The scFv was obtained by PCR amplification of cDNAs for 198/A1 VH and VL regions and cloning in vector pARP2. 198/A1 is an example of anti-human Factor IX (FIX) antibodies of the invention. Anti-FIX/FIXa and their derivatives, including scFv and CDR3 fragments, have Factor VIIIa (FVIIIa) cofactor activity or FIXa activating activity. Administration leads to an increase in the procoagulant activity of FIXa, even in the presence of FVIIIa inhibitors. This allows for rapid blood coagulation even in the absence of FVIII or FVIIIa, and in the case of FVIII inhibitor patients. The antibodies and derivatives are used in a claimed pharmacceutical composition for treating patients with blood coagulation disorders, especially haemophilia A and haemorrhagic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New factor IX/factor IXa antibodies and their derivatives useful for increasing amidolytic activity of factor IXa, and for treating blood coagulation disorders such as hemophilia A and hemorrhagic diathesis
                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ᅜ
                                                                                             Genetic selection in microorganisms, for ligand binding proteins (LBP) comprises: extracytoplasmic presentation of LBP and; using the signal of ligand binding (by signal transduction on the biosynthetic machinery of the microorganisms) to express a detectable or selectable function.

Microorganisms for this process include a genetically stable detection/selection and are transformed with a replicon encoding a fusion protein consisting of the LBP, a transmembrane helix and regulatory galactosidase gene, integrated into the chromosome and under the control of the toxin) promoter. The transmembrane helix is taken from the toxR gene, integrated into the chromosome and under the control of the tox (cholera toxin) promoter. The transmembrane helix is taken from the toxR gene. Four primers (AAQ80457-60) were used in the canstruction of the plasmid phKToxscFV. The primers described in AAQ80457 caner used to amplify variable heavy chain sequence of the single chain antibody NQ10.12.5 and those described in AAQ80459-60 were used to amplify the corresponding light chain sequence of the single thaQ80454-56 for details) to create a toxR-scFV fusion gene. This sequence is the single chain antibody (scFV). (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          25-MAR-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This polypeptide comprises the bispecific tetravalent antibody BiTAb1G10-CC B7-24H6. The molecule consists of 4 scFvs, i.e. 2 anti B7.1 scFvs and 2 cc anti B7.2 scFvs (tetravalency). One single BiTAb is a homodimer of 2 cc identical molecules, each containing both an anti B7.1 and anti B7.2 scFv CC (dispecificity). An anti-B7.1 and and anti-B7.2 scFv are linked using a cc dimerisation domain (see AAW90219), which drives the homodimerisation of the molecule. DNA (see AAW90219), which drives the homodimerisation of cc allow expression of the BiTAb in transformed E. coli cells. The BiTAb cross-links, and/or cross-reacts, with the costimulatory molecules B7.1 cand B7.2 that are expressed on the membrane of professional antigen-cc presenting cells, leading to the inhibition of antigen-specific T cell activation. The invention relates to such B7-binding molecules, methods cof the immune system, in particular graft rejection, graft versus host colleges, allergy and autoimmune diseases (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                This polypeptide comprises the bispecific tetravalent antibody BiTAbB7-24 - IG10H6. The molecule consists of 4 scFvs, i.e. 2 anti B7.1 scFvs and 2 anti B7.2 scFvs (tetravalency). One single BiTAb is a homodimer of 2 identical molecules, each containing both an anti B7.1 and anti B7.2 scFv (bispecificity). An anti-B7.1 and and anti-B7.2 scFv are linked using a dimerisation domain (see AAW90219), which drives the homodimerisation of the molecule. DNA (see AAW90219), encoding the BiTAb has been constructed to allow expression of the BiTAb in transformed E. coli cells. The BiTAb cross-links, and/or cross-reacts, with the costimulatory molecules B7.1 and B7.2 that are expressed on the membrane of professional antigenpresenting cells, leading to the inhibition of antigen-specific T cell activation. The invention relates to such B7-binding molecules, methods are the professional antigen to the series of the professional series of the series of the
                                                                                                                                                                                          Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        문
The invention relates to peptides which are able to confer stability and solubility to an antibody comprising these peptides. The peptides are especially H-FR1, H-FR2, H-FR3 or L-FR4 present within a variable region of an antibody which makes the antibody soluble and stable in cytoplasm. Peptides Having the sequences of HFR1 to H-FR4 are present within the variable region of the heavy chain of an antibody, covalently linked to the H-CDR1, H-CDR2, H-CDR3 in the order (H-FR1)-(H-CDR2)-(H-FR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H-CDR3)-(H
                                                                                                                                                                                                                                                                                                                            comprising these peptides, us associated with accumulation animal cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Key

The antibodies and polynucleotides (e.g. by gene therapy) are useful for the manufacture of a medicament for the treatment of pathologies associated with accumulation of a molecule inside or outside a human, animal cell or plant cell. The pathologies are infectious (e.g. viral infections such as HIV, human immunodeficiency virus, infections), tumour, metabolic and immune (especially auto-immune) pathologies. The present sequence represents the synthetic antibody scFv(F8) which is used as a basis for constructing synthetic antibodies incorporating the peptides of the invention

AAR84816-836 are G9-209 peptides modified to improve immunogenicity. G9-209 is an immunogenic peptide based on the medanoma derived antigen, gp100 (see AAR84210). The peptides are used in medicaments for the treatment or prevention (by immunization) of melanoma. Antibodies against MART-1 and its immunogenic peptides may be used in the detection and isolation of MART-1 from a sample, the detection of which is indicative

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immu animal against melanoma.

and immunise

WPI; 1995-382963/49.

                                                                                                                                                                                                                                       The invention relates to a novel immunogenic peptide comprising 5-2 contiguous amino acids of new melanoma antigen recognised by T lymphocytes (MART-1). The peptide sequence contains at least one an acid modification of MART-1. The peptide is used in diagnostic and therapeutic methods as an immunogen or vaccine to prevent or treat melanoma, and for in vivo tumour recognition and rejection. AAU2888 ABU29008 represent MART-1 peptide amino acid sequences, and related

                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of induction of an immune response, comprising administration of an immunotherapeutic composition, comprising a heat shock protein, and a melanoma antigen, where the melanoma antigen is selected from tyrosinase, tyrosinase related protein 1, tyrosinase related protein 2, gp 100, MAGE antigens, BAGE antigens, NYES01, MART antigens, GM2, antigenic portions and combinations of these. The melanoma antigen is covalently bound to a javelin molecule, where the melanoma antigen bound to the javelin molecule is non-covalently bound to the heat shock protein. The composition is useful for inducing an immune response for the treatment of melanoma. AAU71980-AAU72481 represent melanoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a recombinant single chain major histocompatibility complex (MHC) class I polypeptide comprising an amino acid sequence including a functional human beta-2 microglobulin (in)directly covalently linked to a functional human MHC class I heavy chain and the nucleic acids encoding it. The recombinant MHC polypeptide is used in a method is for generating large quantities of pure single chain MHC class I polypeptides, which is useful in monomeric or multimeric forms to present antigenic peptides to cytotoxic T lymphocyte (CTL) clones. The present sequence is a cancer cell associated peptide which can bind MHC in an experiment demonstrating the production of the

The method involves printing of the animal with an inducing agent such as tetanus toxoid (TT) or diphtheria toxoid (DT), subsequently followed by administration of an inducing agent antigen mixture. The method provides the enhancement or augmentation of the immune response to the antigen and/or improves a vaccination protocol by allowing use of less antigen. The immunhsation of the animal with tumour-associated antigen is useful for the prophylactic or therapeutic treatment of cancer. The present sequence is modified tumour-associated antigen, GP100 peptide fragment related to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enhancing immune response to antigen such as tumor antigen for t cancer in an animal involves administering an inducing agent to animal followed by administering inducing agent-antigen mixture.
The present invention relates to a method for the preparation of ready-for-use, cryopreserved, mature dendritic cells comprising growing immature dendritic cells in a culture medium that includes a 'maturation cocktail' of one or more maturation stimuli and freezing the resulting matured cells in a freezing medium that does not contain heterologous serum. When loaded with antigens, the dendritic cells can be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;

                                                                                                                                   The invention relates to immuno-molecules comprising a soluble human major histocompatibility complex (MHC) class I effector domain and a targetting domain linked to the effector domain, useful for immune deception. The invention also relates to methods for immune deception. The method is useful for producing an immunomolecule, and selectively killing a cell in a patient. The immuno-molecule are useful for immune deception, particularly treating cancer. The immuno-molecules and methods are useful for recruiting active cytotoxic T cells for tumour killing via cancer-specific antibody or ligand guided targetting of single-chain MHC-peptide complexes. The present sequence is a tumour associated HLA-A2-restricted peptide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                     New immuno-molecules comprising a soluble human major histocompatibility complex class I effector domain and a targeting domain linked to the effector domain, useful for immune deception, particularly in treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 9

M15 is a human CD8+ CTL clone that specifically recognises an HLA-A2-restricted epitope of the gp100 melanoma antigen. M99 is an HLA-B7-restricted CD8+ CTL clone which recognises an epitope pf carcinoembryonic antigen. The human T cell clones which are generated were used in the method of the invention for treating cancer, such as haematological cancer, neurological cancer, melanoma, breast cancer, lung cancer, head and neck cancer, gastrointestinal cancer, genitourinary cancer, bone cancer or vascular cancer, or infections by influenza virus, HIV, M. tuberculosis, or P. falciparum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 9 AA;

CC The invention relates to a fusion agent (Trojan antigen; TA) comprising a CC transport domain, two cleavage sites, a peptide epitope recognised by an CC antigen-specific receptor on an effector T-lymphocyte precursor cell and CC a biologically active agent, where there is a cleavage site between the CC peptide epitope and the biologically active agent and between each CC immunogenic or antigenic. It is also useful for preventing and treating CC an infectious disease such as viral, bacterial, protozoal, fungal or CC yeast disease, or proliferative disease such as cancer (e.g. melanoma, CC neural tissue, gastrointestinal, breast, lung, ovarian, testicular, CC prostate, cervical, bladder, vaginal, liver, renal, bone, haematological CC or vascular tissue cancer). The invention is used as vaccines. The cc present sequence is melanoma gp100 eptiope. This peptide is used in the cx comparison of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fusion agent useful for preventing and treating an infectious disease, a proliferative disease, such as cancer, comprises a transport domain, two cleavage sites, a peptide epitope and a biologically active agent.
                                                                                                                              Sequence 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1; Page 37; 72pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for identifying peptides originating from a particular cell type, which are capable of binding to major histocompatibility complex (MHC) molecules of a particular haplotype. The method comprises analysing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype. The method is useful for identifying peptides for treating an autoimmune disease, such as T or B cell and/or allergic disease or condition, rheumatoid arthritis, or multiple sclerosis, neurodegenerative disorders, e.g. Alzheimer's disease, or diseases associated with inflammation. The sequences of the invention may be used in a gene therapy application. This sequence represents a peptide relating to the method for identifying MHC binding peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric polypeptide; antigenic peptide; MHC class I; major histocompatibility complex class I, beta-2 microglobulin; MHC class I; crycotoxic T-lymphocyte; MHC binding T cell epitope; primary CTL induction; melanoma antigen gp100; cancer; G9-209-2M.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a chimeric polypeptide (I) comprising an antigenic peptide capable of binding a human major histocompatibility complex (MHC) class I, a functional human beta-2 microglobulin and a functional human MHC class I heavy chain. The chimeric polypeptide is useful in generating large quantities of pure single chain MHC class I polypeptides which can be used in monomeric or multimeric form to present antigenic peptides to cytotoxic T-lymphocyte (CTL) clones. They may also be used in rapid, sensitive and reliable MHC peptide binding assay to identify high affinity MHC binding T cell epitopes, in in vitro primary CTL induction studies to define those peptides that are immunogenic, and to generate antibodies. This is the amino acid sequence of a cancer cell associated peptide derived from melanoma antigen gp100 and used for major histocompatibility (MHC) binding

New protein comprising an immunoglobulin heavy chain variable (VH) domain and an immunoglobulin light chain variable (VL) domain, useful for preparing a composition for treating or preventing a cancerous disorder.

The present invention describes a protein comprising an immunoglobulin

Claim 4; Page 137; 224pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC (Ig) heavy chain variable (VH) domain and an Ig light chain variable (VL) CC domain. The protein binds a complex comprising a major histocompatibility CC complex (MHC) and a peptide, does not substantially bind the MHC in the CC absence of the bound peptide, and does not substantially bind the peptide CC in the absence of the MHC. The peptide is a peptide fragment of gpl00, CC MUC1, TAX or hTERT. ALSO described: (1) a pharmaceutical composition CC comprising the novel protein and a carrier; (2) a cytocoxic T cell CC comprising an MHC and a peptide, does not substantially bind the MHC in the absence of the bound peptide, and does not substantially bind the MHC comprising a first segment that encodes the I variable domain; (4) a CC comprising a first segment that encodes the I variable domain; (4) a CC comprising theterologous nucleic acid sequences that encodes the cell comprising heterologous nucleic acid sequences that encodes the protein; (5) a transgenic animal whose genome includes heterologous nucleic acid sequences that encodes the protein that specifically binds the MHC-peptide complex; (7) expressing CC an antigen-binding protein; (8) ablating or killing a target cell that cardisplays a peptide on a surface MHC molecule; (9) treating or preventing a cancerous disorder in a subject; and (10) detecting an MHC-peptide complex in a sample. A protein of the invention has cytostatic activity, and can be used in gene therapy. The protein is useful for preparing a cardically binds the represent sequence represents a gp100-derived peptide, which is used in the present complex in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an isolated molecule comprising an antibody specifically bindable with a binding affinity below 20 nanomolar to a human major histocompatibility complex (MHC) class I being complexed with a HLA-restricted antigen. The molecules, antibodies, and methods are useful for treating cancer, viral infection and an autoimmune disease. The invention is useful in gene therapy. The present sequence is HLA-A2
                                                    The invention relates to an immunogenic peptide having contiguous amino acids derived from the sequence of melanoma antigens recognised by T-lymphocytes (MART-1) or gpl00. The MART-1 sequence appears as ADB97651, and the gpl00 (differing by 1 amino acid from the previously published gpl00 (ADB97770) appears as ADB97676. Also included are a pharmaceutical composition (comprising the above peptide and an excipient, diluent or carrier), a vaccine for immunising a mammal (comprising the above peptide in a carrier), preventing or treating melanoma (comprising administering the above composition to a mammal in an amount to stimulate the production of protective antibodies or immune to stimulate and isolated nucleic acid sequence encoding the above peptide, a recombinant expression vector comprising at least one nucleic acid sequence cited above, a host organism transformed or transfected with the vector content of the particular and antibodies or reactive with the vector content of the particular and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; melanoma antigen recognised by T-lymphocytes; MART-1; melanoma; skin cancer; T lymphocyte; cytostatic; gene therapy; vaccine; antigen; major histocompatibility complex; MNG; human leukocyte antigen; HLA-A2; tumour infiltrating lymphocyte; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADB97733 standard; peptide; 9 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New immunogenic peptides derived from melanoma antigens recognized by lymphocytes or from gp100, useful for preventing or treating melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kawakami Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             22-APR-1994;
